                                                                                                                                                                                        converting fructose 6P into glucosamine-6P using glutamine as a nitrogen source (By similarity).

CATALYTIC ACTIVITY: L-glutamine + D-fructose 6-phosphate = L-glutamate + D-glucosamine 6-phosphate.

SUBUNIT: Homodimer (By similarity).

SUBCELLULAR LOCATION: Cytoplasm (By similarity).

SIMILARITY: In the C-terminal section; belongs to the SIS family.

SIMILARITY: Contains 1 type-2 glutamine amidotransferase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Gaps

Glucosamine--fructose-6-phosphate
aminotransferase [isomerizing].
/FITG=PRO 0000135377.
Glutamine amidotransferase.
GATase [By similarity).
Isomerization Fru-6P [By similarity).
My. BOCEDA3B6F00F7D CRC64;
SIMILARITY: Contains 1 type-2 glutamine amidotransferase domain.
                                                                                                                                                                                                                                                                                                        Pfam; PF00110; GATase 2; 1.

restricted serovars of Salmonella enterica that cause typhoid.";
Nat. Genet. 36:1268-1274(2004).
-!- FUNCTION: Catalyzes the first step in hexosamine metabolism,
-converting fructose.6P into glucosamine-6P using glutamine as
nitrogen source (By similarity).
-!- CATALYTIC ACTIVITY: L-glutamine + D-fructose 6-phosphate = L-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Glucosamine-fructose-6-phosphate

17-JUL-2002, sequence version 2.

17-MR-2006, entry version 21.

Glucosamine-fructose-6-phosphate aminotransferase (isomerizing)

(EC 2.6.1.16) (Hexosephosphate aminotransferase) (D-fructose-6-
phosphate amidotransferase) (GFMT) (L-glutamine-D-fructose-6-phosphate
amidotransferase) (GFMT) (L-glutamine-D-fructose-6-phosphate
smidotransferase) (GHUCOSSMININ-6-phosphate synthase).

Bacteriol. 185:2330-2337(2003).
-!- FUNCTION: Catalyzes the first step in hexosamine metabolism, converting fructose-6P into glucosamine-6P using glutamine as nitrogen source (8y similarity).
-!- CATALYTIC ACTIVITY: L-glutamine + D-fructose 6-phosphate = L-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bacteria; Proteobacteria; Gammaproteobacteria; Enterobacteriales; Enterobacteriaceae; Salmonella.

"Complete genome sequence of Salmonella enterica serovar Typhimurium LT2.";

    Mature 413:852-856 (2001).
    FUNCTION: Catalyzes the first step in hexosamine metabolism, converting fructose-6P into glucosamine-6P using glutamine as a nitrogen source (By similarity).
    CATALYTIC ACTIVITY: L-glutamine + D-fructose 6-phosphate = L-glutamate + D-glucosamine 6-phosphate.
    SUBUNIT: Homodimer (By similarity).
    SUBCELLULAR LOCATION: Cytoplasm (By similarity).
    SUBCELLULAR LOCATION: Cytoplasm (By similarity).
    SIMILARITY: In the C-terminal section; belongs to the SIS family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                               30-AUG-2005, sequence version 2.
07-WAR-2006, entry version 15.
Glucosamine-fructose-6-phosphate aminotransferase [isomerizing]
(EC 2.6.1.16) (Hexosephosphate aminotransferase) (D-fructose-6-phosphate amidotransferase) (GFATV) (L-glutamine-D-fructose-6-phosphate amidotransferase) (GFATV) (L-glutamine-D-fructose-6-phosphate amidotransferase) (GRATV) (L-glutamine-D-fructose-6-phosphate amidotransferase) (GRATV) (Mameleglms) orderedLocusNames=ECA4508)
                                                                                                         EGALKLKEISYIHAEAYAAGELKHGPLALIDADMPVIVVAPNNELLEKLKSNIEEVRARG
                        Proc. Natl. Acad. Sci. U.S.A. 101:11105-11110(2004).

-!- FUNCTION: Catalyzes the first step in baxosamine metabolism, converting fructose-6F into glucosamine-6F using glutamine as a nitrogen source (By similarity).

-!- CATALYTIC ACTIVITY: L-glutamine + D-fructose 6-phosphate = L-glutamate + D-glucosamine 6-phosphate.

-!- SUBCELLULAR LOCATION: Cytoplasm (By similarity).
-!- SIMILARITY: In the C-terminal section; belongs to the SIS family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Erwinia carotovora subsp, atroseptica (Pectobacterium atrosepticum).

"Insights into the evolution of Yersinia pestis through whole-genome comparison with Yersinia pseudotuberculosis.";

Proc. Natl. Acad. Sci. U.S.A. 101:13826-13831(2004).

C. -- FUNCTION: Catalyzes the first step in hexosamine metabolism,

converting fructose-6P into glucosamine-6P using glutamine as a nitrogen source (By similarity).

C. -- GATALYTIC ACTIVITY: L.-Glutamine + D-fructose 6-phosphate = L-

Glutamate + D-glucosamine 6-phosphate.

-- SUMCELLULAR LOCATION: Cytoplasm (By similarity).

C. -- SIMILARITY: In the C-terminal section; belongs to the SIS family.

GFAT subfamily.

-- SIMILARITY: Contains 1 type-2 glutamine amidotransferase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C;Superfamily: glutamine-fructose-6-phosphate aminotransferase (isomerizing)
C;Keywords: aminotransferase; isomerase
F;2-609/Product: glutamine-fructose-6-phosphate transaminase (isomerizing) #status
F;2/Active site: Cys #status predicted
                                                                                                                               ö

AB0955
glutamine-fructose-6-phosphate transaminase (isomerizing) (EC 2.6.1.16) - Salmonella ent
glutamine-fructose-6-phosphate transaminase (isomerizing) (EC 2.6.1.16) - Salmonella ent
N.Alternate names: glucosamine-fructose-6-P aminotransferase [misnomer]
C,Species: Salmonella enterica subsp. enterica serovar Typhi
A;Note: this species has also been called Salmonella tryphi
C;Date: 09-Nov-2001 #sequence_revision 09-Nov-2001 #text_change 28-Jul-2003
C;Accession: AB0955

ABOSOO Glutamine-fructose-6-phosphate transaminase (isomerizing) (EC 2.6.1.16) [imported] - Yerrofspecies: Yersinia pestis
Cispecies: Yersinia pestis
Cispecies: Versinia pestis
Racture ABOSOO B. Prentice, M.B.
Racture ABOSOO B. W.; Chillingworth, T.; Cronin, A.; Davies, R.M.; Davis, P.; Dougan, G.; Pattile A. Rutherford, K.; Simmonds, M.; Skelton, J.; Stevens, K.; Whitehead, S.; Barrell, Rattile Genome sequence of Yersinia pestis, the causative agent of plague.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 14
B81246
Glutramine-fructose-6-phosphate transaminase (isomerizing) (EC 2.6.1.16) NMB0031 [sim glutcamine-fructose-6-phosphate aminotransferase [misnomer]
C.Species: Naisseria meningitidis
C.Date: 31-Mar-2000 #sequence_revision 31-Mar-2000 #text_change 09-Jul-2004
C.Accession: B81246
C.Accession: N.J.; Heidelberg, J.; Jeffries, A.C.; Nelson, K.E.; Eisen, H.Tettellin, H.; Saunders, N.J.; Heidelberg, J.; Jeffries, A.C.; Nelson, K.E.; Eisen, Hickey, E.K.; Haft, D.H.; Salzberg, S.L.; White, O.; Fleischmann, R.D.; Dougherty, E.i, H.; Qin, H.; Vamathevan, J.; Gill, J.; Scarlato, V.; Masignani, V.; Pizza, M.

A;Authors: Grandi, G.; Sun, L.; Smith, H.O.; Fraser, C.M.; Moxon, E.R.; Rappuoli, R.; Ver A;Title: Complete genome sequence of Neisserla meningitidis serogroup B strain MCS8.
A;Reference number: A81000; MUID:20175755; PMID:10710307
A;Accession: B81246
A;Accession: B81246
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-612 <TET>
A;Residues: 1-612 <TET>
A;Acsession: By strain MCS8
C;Genetics: Ascences: UNIPROT:Q9K1P9; UNIPARC:UP1000016563D; GB:AE002361; GB:AE002098; NID:C;Genetics: NMB0031
C;Superfamily: glutamine-fructose-6-phosphate aminotransferase (isomerizing)
C;Keywords: aminotransferase; isomerase
C;Keywords: aminotransferase; bhosphate transaminase (isomerizing) #status predic F;2-612/Product: Glutamine-fructose-6-phosphate transaminase (isomerizing)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AD3595

WPI; 2004-203380/19. N-PSDB; ADI38884 Producing glucosamine or N-acetylglucosamine by fermentation involves culturing microorganism comprising glucosamine-6-phosphate acetyltransferase, in fermentation medium, and collecting product.

Claim 5; SEQ ID NO 30; 327pp; English.

The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (I) which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate

c the transformed cell under conditions that permit the cell to translate the transformed cell under conditions that permit the cell to translate the polymucleotide into a polypeptide comprising an enzyme which is part of the biosynthetic pathway. The hexosamine produced by the method of invention is useful for treating arthritis, preferably osteoarthritis and rehumancia arthritis, in humans and pet animals. The hexosamines are also useful for treating pain, inflammation or inflammation-associated disorder. The hexosamines are also useful for treating other articular conditions and privantle arthritis, gouty arthritis, systemic lupus erythematosus and juvenile arthritis and other joint damage or diseases such as spondyloarthropathy, gouty arthritis, systemic lupus erythematosus and juvenile arthritis and other joint damage disease conditions such as tendinitis, bursitis, connective tissue injuries or disorders, and skin related conditions such as postiasis, eczema, burns and dermatitis. The method provides improved production of hexosamine without compromising its clinical effectiveness and in a form that is acceptable for delivery to a broad class of patients. Consumption of edible portions of transgenic plants containing hexosamines browned as supply of hexosamine to the subject in a conventional and easily consumption of consumption of the portions of transgenic plants containing and easily and easily and easily and easily and easily consumption of the consumption of the consumption of the consumptions of transgenic plants are some enteringed to the consumptions of transgenic plants are correctived as consumption of the consumptions of transgenic plants of saccharders are enteringed to the consumptions of transgenic plants of saccharders are enteringed to the consumptions of transgenic plants are conventional and easily and easily and easily and easily and easily entering the consumptions of transgenic plants are acceptable for the subject in a conventional and easily and easily and easily and easily enterin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                             The specification describes a method for producing chitin or chitosan by a fermentation process. The method involves culturing in a fermentation medium a microorganism which comprises one or more genetic modifications that result in an increase in the activity of glutamine-fructose-6-phosphate amidotransferase (also known as glucosamine-fructose-6-concomine-6-phosphate synthase, and encoded by the GFA1 eukaryotic generations of the glms bacterial gene), glucosamine-6-phosphate acetyltransferase (encoded by GNA1), chitin synthase or chitin deacetylase (encoded by CDA1) and CDA2), or in decrease in the activity of N-acetylglucosamine-6-phosphate deaminase, chitinase and chitosanse, and collecting the chitin or chitosan. The method is useful for producing chitin or chitosan by utilizing microorganisms such as a fungar or A. nidulans. The method enables high quantities of chitin and chitosan to be produced cost effectively. The present sequence is encoded by a GNA1 gene, and is a glucosamine-6-phosphate acetyltransferase. The GNA1 gene, and is a glucosamine-6-phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 QYNPMVIVDKRTETVAATGNIIIERKIIHELGLCGHIEDIAVNSKYQGQGLGKLLIDQLV 120

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by the average of promoter. So that expression of the second allele by the promoter. So that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a fungus to an antifungal agent that inhibits the growth of a diploid fungus or disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosynthetic, transporter, transcriptional, compound catabolism, blosynthetic, transporter, transcriptional, compound signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an essential candida albicans protein used in the method of the invention. Note: The sequence data for this parent is not represented in the printed to berwent by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           60 MOYNPWIVDKRIETVAAIGNIIIERKIIHELGLCGHIEDIAVNSKYQGQGLGKLLIDQL 119

The present invention relates to a method (MI) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) coulturing in a fermentation medium a microorganism (I) which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate synthase (III) or glucosamine-6-phosphate deaminase (IV), or decreases the activity of glucosamine-6-phosphate hactivity of (IV) and increases the activity of glucosamine-1 phosphate N-acetyltransferase (IV), and (b) and collecting the product which is chosen from the group consisting of glucosamine-6-phosphate, N-acetylglucosamine-6-phosphate, N-acetylglucosamine-1-phosphate, and N-acetylglucosamine-1-phosphate, acetylglucosamine-1-phosphate, and N-acetylglucosamine. The present sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ä

The specification describes a method for producing chitin or chitosan by a fermentation process. The method involves culturing in a fermentation a fermentation process. The method involves culturing in a fermentation medium a microorganism which comprises one or more genetic modifications that result in an increase in the activity of glutamine-fructose-e-bhosphate synthase, and encoded by the GFAI cukaryotic gene and the glms bacterial gene), glucosamine-6-phosphate arcaryltransferase (encoded by GNAI), chitin synthase or chitin deacetylarse (encoded by CDAI or in decrease in the activity of N-acetylglucosamine-6-phosphate deaminase, chicinnase and chitosanase, and collecting the chitin or chitosan. The method is useful control of the producing chitin or chitosan by utilizing microorganisms such as thousy yeast (e.g. Saccharomyces or Schizosaccharomyces) and chitosan to be produced cost effectively. The present sequence represents a glucosamine-6-phosphate acetyltransferase, encoded by a GNAI gene which may be used transform microorganisms for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N-acetylglucosamine-6-phosphate deacetylase;
glucosamine-6-phosphate deaminase; chitinase; chitosanase; fungus; yeast;
                                                                                                                                                                                                                                                                                                                                                                                                 Producing chitin or chitosan, involves culturing microorganism with genetic modification that results in increase in activity of glutamine-fructos-6-phosphate amidotransferase, in fermentation medium, to produce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ଚ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by apthogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, to prevent or inhibit formation on a surface of a boidilm comprising A. fumigatus or characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequence of their related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ŋ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes of Aspergillus fumigatus of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         QYNPMVIVDKRIETVAAŢGNIIIERKIIHELGLCGHIEDĮAVNSKYQGQGLGKLLIDQLV 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to alicit another immune response, and for identifying polynucleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3 LPDGFYIRRMEEGDLEQ-VTETLKVLTTVGTITPESFSKLIKYWNEATVW-NDNEDKKIM 60

modification that increase the activity of (II), glucosamine-6-phosphate synthase (III) or glucosamine-6-phosphate deaminase (IV), or decreases the activity of glucosamine-1 phosphate N-acetyltransferase (V), and (D) and collecting the product, which is chosen from the group consisting of glucosamine-6-phosphate, N-acetylglucosamine-1-phosphate, N-acetylglucosamine-6-phosphate, and N-acetylglucosamine-1-phosphate, and N-acetylglucosamine-Theorem of sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (1) which comprises endogenous glucosamine-6-phosphate acetyltransferase (11) and a genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3 LPDGFYIRRMEEGDLEQ-VTETLKVLTTVGTITPESFSKLIKYWNEATVWNDNEDKKIMQ

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at available in electronic form from the US patent office at the polynucleotide of the invention are also useful in physical arrays of molecules and as plant breading markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme cosmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lighin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, introgen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stranspace content. This is the amino acid sequence of a plant full length insert propertie that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for

The nucleic acids and proteins are useful for diagnosis, drug screening, clinical trial monitoring and treatment of diseases and disorders e.g. breast and prostate cancer. NHPs can also be useful for augmenting the efficacy of chemotherapeutic agents used in treatment of breast or prostate cancer. The nucleic acid is also useful in NHP gene regulation, and as antisense primers in amplification reactions of NHP gene sequences. NHPs are useful for producing antibodies. The present sequence represents a novel human transferase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences AAB73494-AAB73535 represent novel human transferase proteins HTFS-1 to HTFS-42, and sequences AAH23801-AAH23842 represent cDNAs encoding them. The proteins play important roles in the regulation of cellular signalling and proliferation. The HTFS proteins are useful for screening compounds for their effectiveness as agonists or antagonists of transferase activity, or for compounds that specifically bind to an HTFS protein or which modulates the activity of an HTFS protein. Pharmaceutical compositions comprising an HTFS protein, HTFS agonist or antagonist, or genetic construct encoding an HTFS protein are useful for treating a disease or condition associated with decreased or increased expression of functional HTFS. Disorders which may be treated using such compositions include cell proliferative disorders and immune disorders. For example, diseases which may be treated include atherosclerosis,

                                                                        specification describes 25324, 50287, 28899, 47007 and 42967 transferases. The 25324 transferase is homologous to kynurenine aminotransferase. The 47007 transferase is homologous to kynurenine aminotransferase. The 47007 transferase is homologous to phosphatidyl transferase. The transferase polypeptides and polynucleotides may be used for the diagnosis or the identification of a compound capable of treating cancer (e.g., lung, breast, or colon) or a disorder characterised by the transferases may be used to treat the above, or modulators of the transferases may be used to treat the above, or modulate cellular proliferation and/or differentiation, or a subject at risk of the above disorders
                                                                                                                                                                                                                                                                                                                                       7

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 13
```

```
The present sequence is that of a human FLJ10607 polypeptide. This is the human orthologue of a Caenorhabditis elegans protein that has been shown nethods for using FLJ10607 axin pathway. The invention provides methods for using FLJ10607 axin modifier genes and polypeptides to identify FLJ10607—modulating agents that are candidate therapeutic agents useful for the diagnosis and treatment of disorders associated with proliferative or impaired axin function and/or FLJ10607 function, especially proliferative disorders such as cancer. Preferred FLJ10607—modulating agents specifically bind to FLJ10607 polypeptides and restore axin function, or are nucleic acid modulators such as antisense oligomers and RNA interference (RNAi) agents that repress FLJ10607 gene expression or product activity, e.g. by binding to and inhibiting the respective product activity. Candidate FLJ10607 modulating agents are tested with an assay system comprising a FLJ10607 polypeptide or nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                64 PMVIVDKRTETVAATGNIIIERKIIHELGLCGHIEDIAVNSKYQGQGLGKLLIDQLVTIG 123

                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                          The present sequence is that of a human FLJ10607 polypeptide. This is the human orthologue of a Caenorhabditis elegans protein that has been shown to have the ability to modify the axin pathway. The invention provides methods for using FLJ10607 axin modifier genes and polypeptides to identify FLJ10607-modulating agents that are candidate therapeutic agents useful for the diagnosis and treatment of disorders associated with defective or impaired axin function and/or FLJ10607 function, especially proliferative disorders such as cancer. Preferred FLJ10607-modulating agents specifically bind to FLJ10607 polypeptides and restore axin function, or are nucleic acid modulators such as antisense oligomers and FNA interference (RNM1) agents that repress FLJ10607 gene expression or product activity, e.g. by binding to and inhibiting the respective nucleic acid (i.e. DNA or mRNA). Candidate FLJ10607 modulating agents are tested with an assay system comprising a FLJ10607 polypeptide or nucleic

                                                     AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively. AAB63467, AAB63467 to AAB63722 to AAB63722 to AAB63467, AAB63467 and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
